

Challenge 07

Flag: -

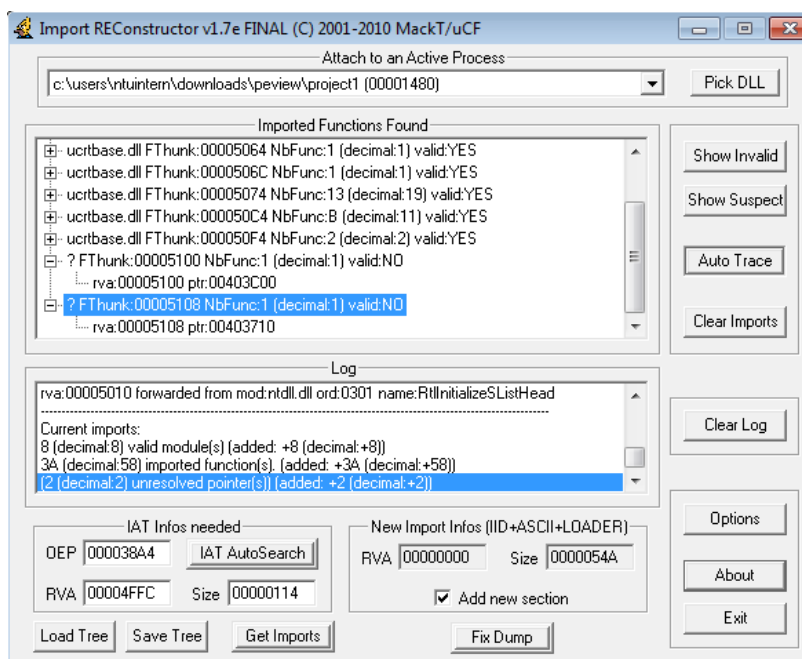

I tried running the application, it shows me that the key is wrong. Probably takes in an argument.

```
C:\Users\NTUIntern\Downloads>Project1
Key is wrong
C:\Users\NTUIntern\Downloads>
```

Check in PEview, found out it was upx packed.

I tried using the standard UPX unpacker to unpack, however it throws me a "CantUnpackException". Tried to manually unpack it using Ollydbg and dump the unpack program. Then I tried using REConstructor to fix the import tables. However, there's a few unresolved imports. Still fix the dump anyways.

Open the fixed dump in Ghidra but couldn't understand much from it. Unable to find "Key is wrong" string as well. Feel like I may have done something wrong when unpacking it.
