

Flag: FLAG{HungRy@ndr01D}

Installed Apk Studio which comes with JADX to allow me to decompile the apk the Java code. The AndroidManifest.xml provides information on the location of the main files. Let's browse into "org.dontlook.wondercrypt.MainActivity"

Some part of the code is encoded using this algorithm.

Rewriting the code in python (script in WonderCryptDecrypt.py), I managed to decode the information.

Since “setContentView((int) R.layout.activity_main)” indicates that activity_main.xml is the current view. We can find all the tag/text values in activity_main.xml. The “clean” file can be seen in WonderJava.java.

```

1 import android.widget.Button;
2 import android.widget.TextView;
3 import java.security.MessageDigest;
4 import javax.crypto.Cipher;
5 import javax.crypto.spec.IvParameterSpec;
6 import javax.crypto.spec.SecretKeySpec;
7
8 public class MainActivity extends AppCompatActivity {
9     public String a(String str) {
10         byte[] decode = Base64.decode(str, 0);
11         byte[] bArr = new byte[decode.length];
12         for (int i = 0; i < decode.length; i++) {
13             bArr[i] = (byte) (((byte) (decode[i] - 7)) ^ 193);
14         }
15         return new String(bArr);
16     }
17
18     /* access modifiers changed from: protected */
19     public void onCreate(Bundle bundle) {
20         super.onCreate(bundle);
21         setContentView((int) R.layout.activity_main);
22         ((Button) findViewById(R.id.btn_encrypt)).setOnClickListener(new OnClickListener() {
23             public void onClick(View view) {
24                 String a2 = "mylongpasswd";
25                 TextView textView = (TextView) MainActivity.this.findViewById(R.id.lbl_quote);
26                 String hexString = "deadbeef";
27                 String str = "deadbeefgoodbeef";
28                 String charSequence = "THISISTHEFLAG"; //FLAG
29                 try {
30                     SecretKeySpec secretKeySpec = new SecretKeySpec(MessageDigest.getInstance("SHA-256").digest(a2.getBytes("UTF-8")), "AES"); //To SHA-256: "longpasswd"
31                     IvParameterSpec ivParameterSpec = new IvParameterSpec(str.getBytes("UTF-8")); //To Bytes(ascii to hex): "deadbeefgoodbeef" -> 64 65 61 64 62 65 66 67 6f 6f 64 62 65 65 66
32                     Cipher instance = Cipher.getInstance("AES/CBC/PKCS5Padding");
33                     instance.init(1, secretKeySpec, ivParameterSpec);
34                     String encodeToString = Base64.encodeToString(instance.doFinal(charSequence.getBytes()), 0); // fRwyt+Lz+ZTBY6lnHqAyBbhYVSHdCF8cKNcudCrqZxAlIq+V2L40XrVMezTecUa0
35                     b b = new MainActivity.this.b();
36                     b.setTitle("WonderCrypt");
37                     b.a("Message successfully encrypted!");
38                     b.a(-1, "OK", new DialogInterface.OnClickListener() {
39                         public void onClick(DialogInterface dialogInterface, int i) {
40                             dialogInterface.dismiss();
41                         }
42                     });
43                     b.show();
44                     ((TextView) MainActivity.this.findViewById(R.id.txt_encrypted)).setText(encodeToString);
45                 } catch (Exception e) {
46                     throw new RuntimeException(e);
47                 }
48             }
49         });
50     }

```

The secretKeySpec is string a2 hashed with SHA-256 and IV is string str. The encryption used is AES-CBC. Since SHA-256 is used to obtain the key, the key is 32bytes. Meaning it's an AES-256 algorithm and not AES-128. Base64 decoding the encrypted message given to hex we get:
